1. Game Concept & Narrative Arc

PreIncarnation is a genre-defying Adventure RPG where death is not a failure state, but the ultimate win condition. To "beat" the game, the player must die, triggering a cyclical journey of death and rebirth.

With each cycle, the player resists nirvana. Utilizing multi-dimensional spatial analogies, the soul acts as a hyper-fluid, navigating karmic pressure to manipulate the malleable nature of time. The protagonist evolves from a mortal being into an **Embryonic God**. A soul must enter a state of universal growth, becoming a universe from the Big Bang to total entropy, feeling and remembering every experience. After successive universal cycles, the embryo matures into a God, unlocking the Soloverse (or Tropoverse)—a spherical spectrum of fluid fact, fiction, imagination, and history.

2. Gameplay Loop & Rebirth Mechanics

- **New Game+ Reincarnation:** Upon dying (winning), the player enters an upgrade matrix in Limbo/Purgatory. They assign accumulated **Karma Points** (positive or negative energy from previous feats) to exert influence over their next incarnation.
- **Incarnation Selection:** Players can return as entirely different characters, species, or backgrounds—ranging from a higher-level officer, a politician, a smuggler, or a more powerful cosmic entity.
- **Persistent Feats:** While the character changes, the feats and accomplishments of previous incarnations resonate through the universe, directly impacting the new world state.
- **Arbiter of Fates & Heavenly Crowns:** By determining the fate of major universal entities, players earn "Heavenly Crowns," special currencies spent strictly in the preincarnation Limbo state to unlock god-tier upgrades.

3. World Building & Environments

The journey begins grounded in the mundane before expanding into the cosmic. The initial mortal incarnation is anchored in the rural, atmospheric territory of **Addison County, Vermont**, with the central hub located in a digitally reimagined **Rutland**. As the player completes revolutions across various planes of existence, these familiar Vermont territories fracture and expand into myriad dimensions, serving as the foundational building blocks of the player's personal universe.

4. Software Architecture & Tech Stack

To support the complex data flows of the karmic matrix, the software architecture will utilize our standardized robust framework:

- **Backend & Logic:** **Python** and **FastAPI** will drive the backend simulation, handling the heavy multi-dimensional calculations representing the player's soul growth and universe cycles.
- **Frontend & Tooling:** **TypeScript** and **Next.js** will be used for the out-of-game companion apps, lore databases, and the player-facing Limbo Upgrade Matrix interfaces.
- **Telemetry & Agent Health:** The system will integrate homeostatic telemetry. Using biological sensing analogies, the game will monitor the "health" of the underlying AI agents driving the NPCs, ensuring their entropy levels balance with the player's universal growth.
- **Browser Extensions (Optional Lore Integrations):** Built on **Manifest V3**, passing strict compliance testing against OneTrust, Cookiebot, CookieYes, Quantcast Choice, and Usercentrics.

5. UI/UX & Sensory Accessibility

The interface must prioritize senior usability standards and strictly adhere to WCAG guidelines for aging vision, ensuring the 16-bit retro aesthetic remains completely accessible:

- **Visual Clarity:** High-contrast color palettes (deep space blues against bright gold/white text) with scalable typography. No essential information will be conveyed by color alone.
- **Sensory-Derived Interfaces:** The upgrade matrix will feature sensory-derived feedback, using tactile and audio cues to map the complex, multi-dimensional spatial analogies of the player's karmic pressure.
